

## Project: “Csavings”

This program will help out with the savings of a person depending the salary and the time that the person needs, for example if we earn per week 3000 mxn and we want to save around 12,000 mxn in 2 months the program would be able to take a percent of our salary and calculate it, in this case we should save 1500 mxn per week.

Another aspect of the program is that we can check our earning in the final of the month to check if we reach the goal or not.

Inputs:

- Salary.
- Time lapse.
- The amount that we want to save.

Outputs:

- The amount we should save per week
- We would be able to check our savings

The program will display an interactive menu in which we can navigate and decide the quantity that we want to save, the time lapse and our salary and by arithmetical operations will calculate the money.
